

ResonantOS 2.0.0-alpha

A browser-first AI “Augmentor” — a Chrome side-panel extension plus a local model-routing bridge. This page is where things stand, what’s safe to test today, and the best places to make a first contribution.

branch **dev @ 6f92af7** open issues **78** beta.1 **23 open** beta.2 **15 open** tests **704 green**

● SHIPPED & WORKING

Provider Fabric, bridge auth, page Q&A

multi-model routing with visible fallback; install → chat works today

● IN REVIEW

Browser-agent safety fixes

#268 (public-submit handoff) & #269 (live-test harness) — the beta.1 safety gate

● BOARD & DOCS

In full sync

every open task has a priority, an owner-area, and a code entry-point

GOOD FIRST ISSUES

vetted, well-scoped, low-risk — each names the file to start from

These four are labelled good first issue. They extend features that already work, have a clear entry-point and a focused test, and touch no safety-critical code. Comment on the issue to claim it before you start.

#218 good first issue ☒ extends shipped

Page-understanding fixtures

Add focused test fixtures for article-, PDF-, and media-like pages so the Augmentor’s page reading and its “unsupported content” messages are covered. Mostly writing tests against an existing capability — a gentle way in.

START `.../src/lib/chat-turn-controller.js` · `pageContextForSnapshot`
TEST `node --test browser-first/test/chat-turn-controller.test.mjs`

#221 good first issue ☒ extends shipped

One-click & question summaries

Round out the summarize flow (there’s already a summarize action at shortcut S). Add the question-driven path and its coverage. Small, self-contained, user-visible.

START `.../src/lib/content-inline-actions.js`
TEST `node --test browser-first/test/composer-controller.test.mjs`

#219 good first issue new action

Counterpoints & explain-jargon

Add two inline actions — “give me the counterpoint” and “explain the jargon” — to the selection menu. The existing explain action (shortcut E) is a working template to copy.

START `.../src/lib/content-inline-actions.js` · `extend inlineActionList`

#237 good first issue draft PR open

Augmentor workflow recipes (docs)

Write step-by-step recipes (job search, travel, study, product research) for the Product Guide. Pure docs — no runtime code. **Note:** a draft [PR #239](#) exists, so the best help here is **reviewing or extending it** rather than starting fresh.

START `docs/product/PRODUCT_GUIDE.md` + a new docs/ recipes page

TEST node --test browser-
first/test/composer-
controller_test.php

TEST npm run docs:check && npm run
test:docs

Ready to level up? Once you've landed one of the above, these are the natural next tasks — bigger, still well-specified, each with a handoff block in the issue: [#252](#) explicit @tab referencing · [#220](#) cross-tab comparison with provenance · [#241](#) Alt+A / Alt+S shortcut contract.

HOW A CONTRIBUTION FLOWS

issue → PR → green CI

01

Claim an issue

Comment to claim it.
Every issue carries a **Contributor handoff** block — an entry-point file, a focused test, and the runtime boundary.

02

Start from the file

Open the named module. Read AGENTS.md + docs/reference/CAPABILITY_M to for context. Stay inside the browser-first Alpha runtime.

03

Test as you go

Run node --test <file> to target one suite. npm run test:browser-first runs all 704 — it ignores path args, so use node --test to focus.

04

Open a PR

CI runs verify:alpha (build + docs + the full suite). Green CI + a short “what/why” is all a review needs.

THE ROADMAP

where the project is headed

TODAY · GO

Try it, safely

- **Install → bridge → provider → chat** works now
- Page Q&A, highlight-to-ask, summaries
- Add a provider → routing → visible fallback
- **Agent Control stays off** for community testing

THE GATE · IN REVIEW

Agent-control safety

- **#268** public-submit is human-only, non-bypassable
- **#269** the live-browser test harness, restored
- then **#223 / #224 / #226** live safety proofs
- closes epic **#211** — opens community agent testing

BETA.1 · 23 OPEN

Acceptance surface

- Page/chat acceptance + shortcuts (**#218 #220 #221 #241 #252**)
- Onboarding & tester setup (**#213 #230**)
- Living-Archive continuity (**#212 #228**)
- Provider trace & artifacts (**#214 #225 #232**)

BETA.2 · 15 OPEN

Connectors & more

- Gmail / Calendar connectors, voice, personalization
- All **opt-in, consent-gated, deferred** for now
- Needs an OAuth + secure-vault foundation first
- Not yet ready to pick up — tracked, not started

WHAT THE AUGMENTOR MUST NEVER DO

the human-only boundaries

If you touch Agent Control, these lines are load-bearing. The extension refuses them by design — a change that lets any of these happen automatically is a regression, not a feature.

BOUNDARY	RULE	REFERENCE
Public submit / post / publish	Prepared, then the human clicks it on the page — never auto-submitted	#240 · #268
Password / payment / card fields	Never typed into by the agent; human-only	#224
Wallet connect / sign · checkout · login	Hard-blocked; refused, not approvable	#12 · #211
Email / calendar send	Draft only; the human sends	#234 · #235
Stop / cancel	Always available; leaves no dangling action	#226

If you're testing and the agent crosses one of these *without* an explicit human action, stop and file a security issue — that's a boundary regression.

For maintainers & reviewers: the companion due-diligence review and full technical roadmap live in a separate report. This session brought the board into full sync, closed the executability gaps (every task now names a code entry-point), and put the two safety-gate fixes (#268, #269) into review with cross-vendor certification.
